WELCOME ADDRESS: Jeannot Erpelding, Chamber of Commerce of
the Grand Duchy of Luxembourg

一带一路

Luxembourg Chamber of Commerce & China-Luxembourg Chamber of Commerce
One Belt One Road Event Series

HPC PROGRAM IN EUROPE AND LINKING WITH LUXEMBOURG INNOVATION STRATEGY: Jean-Marie Spaus, Luxembourg Ministry of the Economy

HPC program in Europe and linking with Luxembourg's Innovation Strategy

China's Belt & Road Initiative - ICT

Luxembourg's Innovation Strategy

- Preparing Luxembourg for the “digital economy”
 - Study: The 3rd Industrial Revolution
 - Support adoption of HPC and Big Data technologies in Luxembourg
- Implementing a state of the art HPC-Big Data environment for Europe and Luxembourg
 - European initiatives : EuroHPC and the IPCEI initiative
 - National initiative : Plan to create a national HPC-Big Data Competence Center

Preparing Luxembourg for the “digital economy”

- HPC - Big Data infrastructures and applications are contributing significantly and increasingly to scientific progress, industrial competitiveness, national and regional security and the quality of human life.
 - The Luxembourg government presented “The 3rd INDUSTRIAL REVOLUTION” study in November 2016.
 - The aim of the initiative is to prepare the transition to a “digital economy”; to strengthen and consolidate in the long term the country's position in a globalized economy.

HPC & Big Data are important enabling parts of the “The 3rd INDUSTRIAL REVOLUTION” initiative.

- Helping the Lux. economy to stay competitive in a very tough business environment.
- Transfer of scientific and engineering solutions to private companies.
- Development of new business opportunities and business models.
- Development of HPC-Big Data skills.

Developing a state-of-the-art HPC-BD environment for Europe and Luxembourg

How are we going to achieve this?

- Luxembourg together with France, Italy and Spain launched an “Important Project of Common European Interest” (IPCEI) on HPC and Big Data Enabled Applications.
- Luxembourg intends to develop in the framework of the IPCEI a number of HPC-Big Data applications.
- Luxembourg is a leading player in the European HPC initiative
- Important socio-economic subjects will be addressed in this context

Enhancing Luxembourg's ICT value chain

- High performance computing resources will complete Luxembourg's first class IT landscape with new service oriented components.

An additional **value proposition** for companies and investors

HPC and BDA
enabled services

State of the art and easy to access high performance computing resources.
Preinstalled massive and rapid online data storage for Data analytics and Big Data Applications (pay as you use model).

Data Centers

High Quality Data Centers,
Equipment Housing, Hosting and Maintenance,
of customer owned/leased equipment.

Optical Fiber Networks

Secure & redundant world wide connectivity via national & international broad band networks.

Luxembourg plans to create a national HPC-Big Data Competence Center

- HPC-BD technologies are required for an increasingly wide range of disciplines within academia and industry to remain competitive and boost innovation.
- The use of large computational resources for modelling and simulation has become an increasingly important practical and strategic tool to reach solutions fast, or even break new grounds.
- This constitutes HPC as a virtual laboratory of great importance to many companies and should thus be easily accessible and usable.

The national HPC-BD Competence Center should provide a range of services to its customers:

- access to state-of-the art HPC-BD infrastructures (hardware investment),
- advanced and deep technical expertise for helping companies to leverage HPC effectively,
- co-development of customer-specific algorithms & software applications,
- industry training programs.

China & Luxembourg; an historical relationship

- The roots of relationship reach back to a time before Luxembourg was a financial centre and when the coal and steel industry was still booming.
- Diplomatic relations between the two countries were officially established in 1972
- Today, 45 years later, the Grand-Duchy hosts seven Chinese financial institutions.
- Luxembourg also serves as a channel for European investments into China and Asia.
- Luxembourg and China keep knotting close ties.

Economic & Trade Missions to China:

- 2012, 2013, 2016, 2017,

The Belt and Road Initiative (BRI)

BRI seeks to bring together the Silk Road Economic Belt and the Maritime Silk Road through a vast network of railways, roads, pipelines, ports and telecom-infrastructures.

The Belt and Road Initiative (BRI)

- Introduced by China's President Xi Jinping in 2013, the Belt and Road Initiative (BRI) is a global development concept that wants to achieve economic and social integration from Asia to Europe.
- The initiative aims to boost economic development, investment, and cultural exchanges throughout Eurasia by funding port, rail, road construction and telecom-networks along routes linking China and Europe.
- Turning this grand vision into reality requires close collaboration between countries, between public and private sectors, and between people from different cultures.
- Telecom-infrastructures represent an essential part in the BRI initiative. Enhanced connectivity will provide positive impacts to other economic sectors because ICT technologies are essential components in a global value chain.

Thank you

Automotive Sector

Towards green, connected and automated mobility

Luxembourg automotive sector

Facts and figures

- ✓ About 50 companies
- ✓ OEM's (2), component suppliers, connectivity & smart mobility service providers
- ✓ University of Luxembourg and 2 Luxembourg based public research institutes
- ✓ About 1,5 billion € sales turnover
- ✓ About than 2.5 billion € additional turnover (equivalent) related to Luxembourg based R&D cost-centres
- ✓ About 10.000 employees in total
- ✓ About 2.500 multi-lingual and multi-cultural professionals in R&D
- ✓ Sector “powered” by German, French and Italian automotive engineering experts
- ✓ Export to 5 continents
- ✓ **Founding member of AUTOREGION (Greater Region - cross border - automotive cluster)**

Luxembourg automotive sector

Our global players

Coverage of all major key-competences

Vehicle dynamics

Connectivity & mobility services

ADAS – automated driving

Chassis & body

Powertrain (engines, BEV, HEV)

Comfort & Convenience - HMI

Luxembourg Greater-Region

11.5 million European inhabitants, 4 different European countries, all founding members of the European union, speaking 3 European languages in average (English, German, French)

In the heart of Europe, well connected to all major European automotive development centres

Greater-Region, the Autoregion

Luxinnovation is founding member of **Autoregion e.v.**, connecting the automotive eco-systems in Lorraine (F), Rheinland-Pfalz (D), Saarland (D) and Luxembourg (L). The Greater-Region is hosting **8 OEM's**, more than **15 public research centres** and over **500 suppliers**! Together they generate about **150.000 jobs** in automotive production, product- and process-development and (fundamental) research

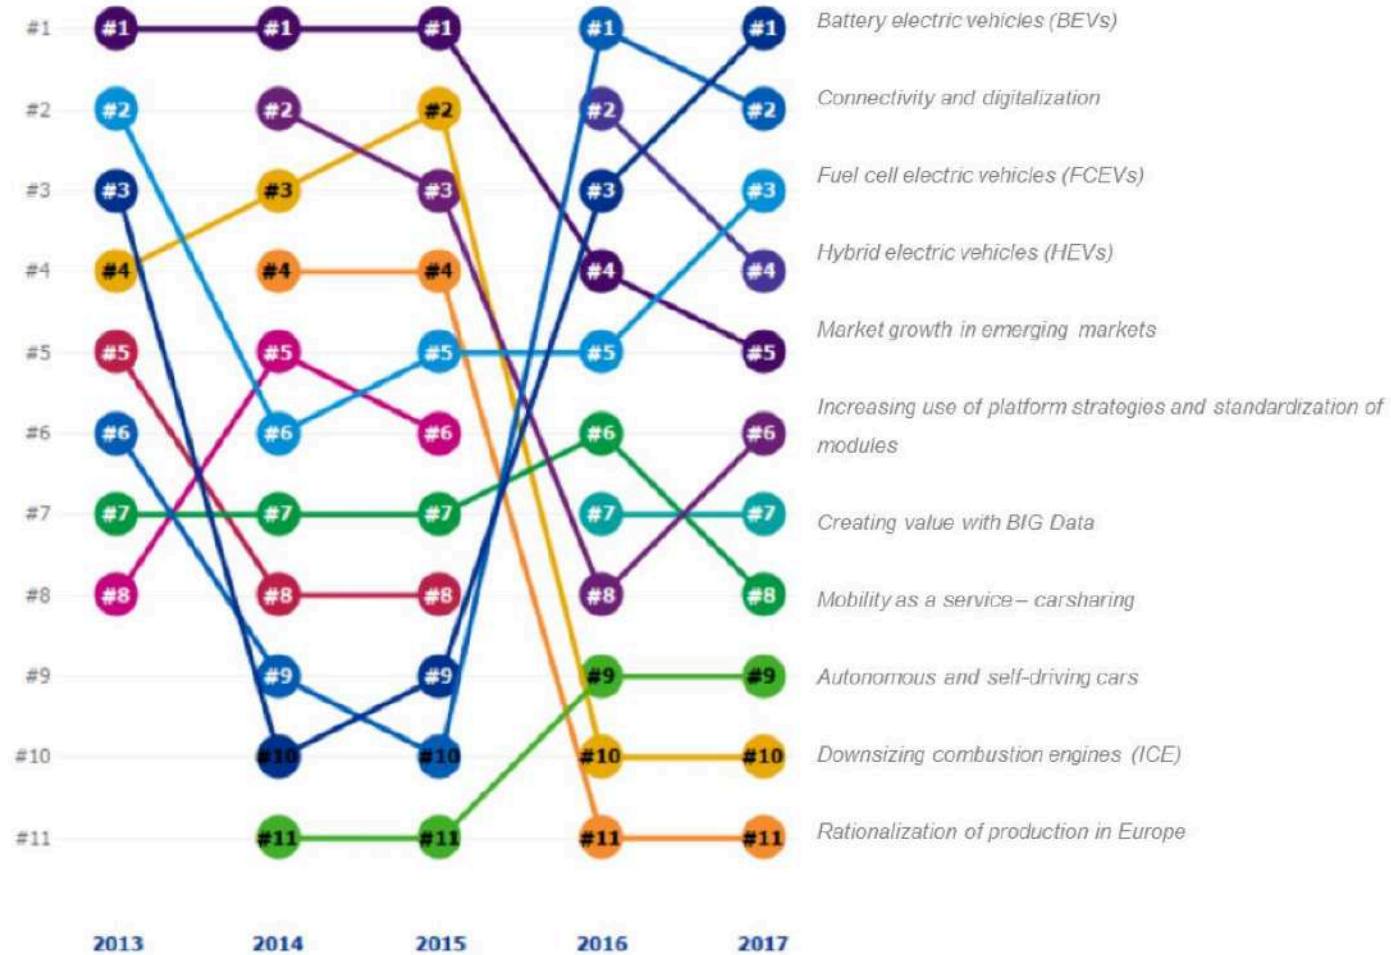

Greater-Region, the R&D region

LIST Luxembourg institute for science and technology **SnT** Security and Trust **DFKI** Deutsches Forschungszentrum für Künstliche Intelligenz **INM** Leibnitz Institut für Neue Materialien **MPII** Max-Planck Institut für Informatik **MECS** Material Engineering Center Saarland **IVW** Institut für Verbundwerkstoffe **CISPA** Centre for IT-security, Privacy and Accountability **ZeMa** Zentrum für Mechatronik **FITT** Institut für Technologie Transfer **Fraunhofer IZFP** Institut für Zerstörungsfreie Prüfverfahren **IRT M2P** Institut de Recherche Technologique – Matériaux, Métallurgie et Procédés **Materialia** Pôle de compétitivité de Matériaux **CeaTech** New energy, Biotech, Digitalisation, Material science **MetaFensch** Métallurgie

Automotive sector – growth strategy

#1 Electrification of mobility

#2 Connectivity, digitalization, automation

Connectivity, digitalization, automation

The internet car

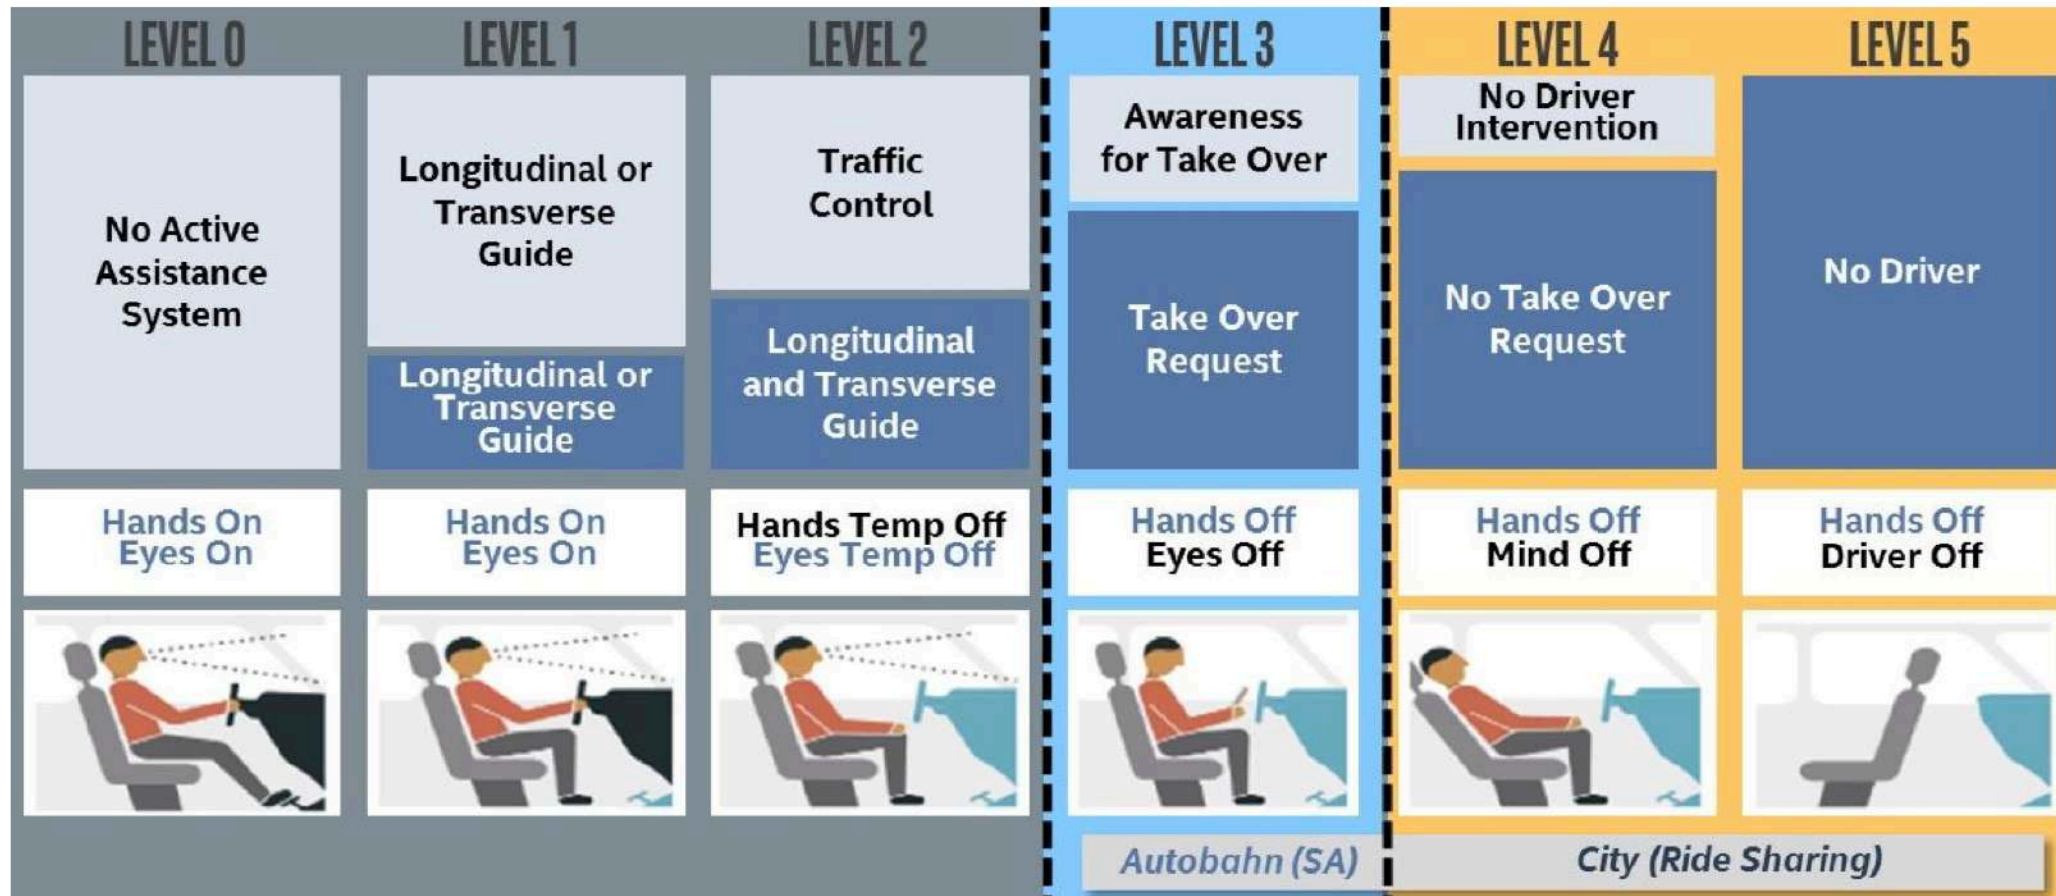

Future vehicles will become “smart devices” facilitating internet-based services, creating new business-opportunities and business-models (e.g. ride sharing, car sharing), reducing costs of mobility, increasing on-board efficiency, improving customer satisfaction and loyalty

The self-driving car

Car connectivity will play an important role in the development of automated driving, using safety relevant data provided by smart infrastructures: dynamic HD maps with real time updates on road conditions, exact position of traffic jams and accidents. If necessary, position, direction and speed of other road users. Safety-relevant data needs to be reliable and secure, and safety-relevant connectivity needs to be uninterrupted

Automated driving roadmap

> 2020

Connected & automated driving

Examples of use-cases in connected & automated driving. Many other use-cases are in discussion with industry players and RTO partners, in Luxembourg and the Greater-Region. On behalf of testing and validation of the use-cases, German, French and Luxembourg authorities are developing a cross-border digital testbed!

Cross border digital testbed - objectives

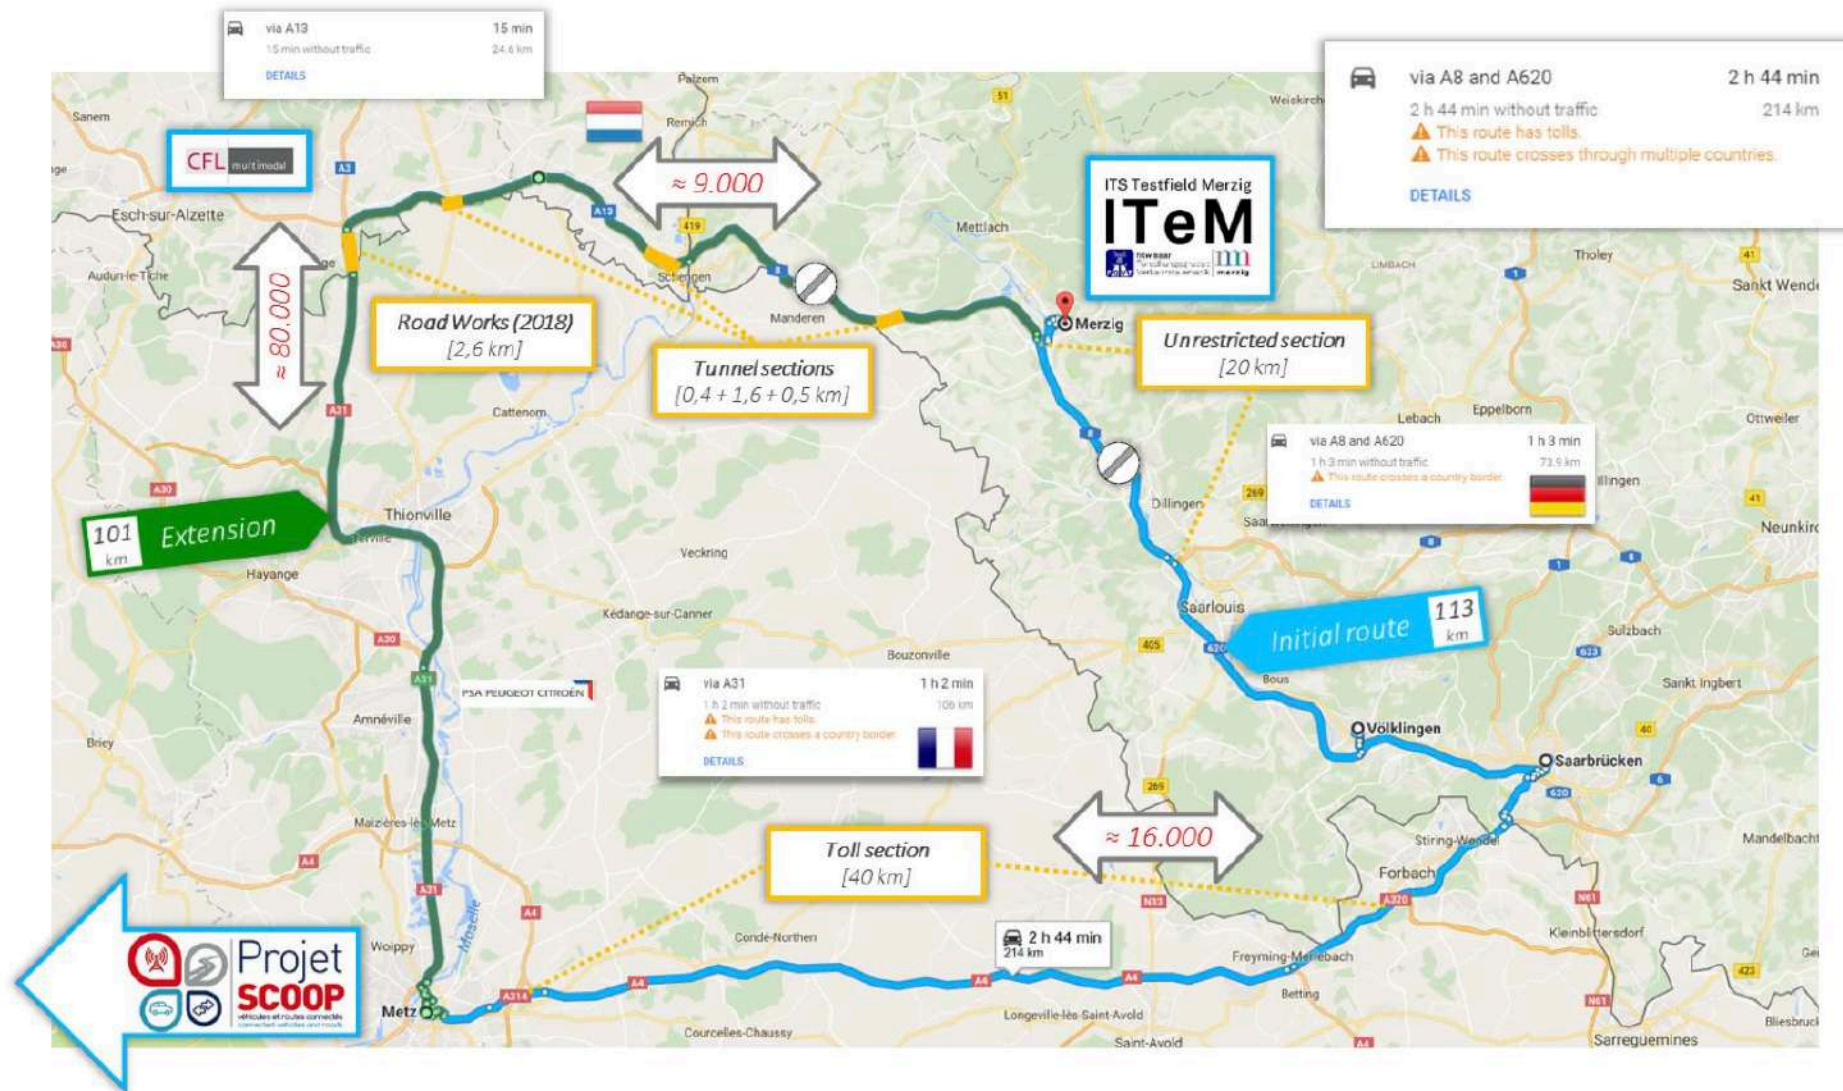

Extension to Luxembourg agreed and signed on the 14th of September 2017

1. Test compatibility (inter-operability) of automated driving vehicles
2. Development and testing of use-cases in connected & automated driving
3. Study the impact and effects of automated driving on future mobility
4. Development of BIG DATA enabled services supported by High-Performance Computing (HPC)

Cross border digital testbed

Open testbed on behalf of the development, testing and validation of automated driving vehicles and next generation C-ITS technologies.

Uninterrupted cross-border 5G connectivity supported by vehicular Wifi (G5) and satellite communication. Use-cases and technical constraints (specification) in discussion with ICT, Telecom and Automotive industry-players

Mobility Innovation Campus

Project	Automotive Campus Bissen
Strategy	Public – Private partnership in open innovation and shared R&D on behalf of next generation green, connected and automated mobility
Capacity	Total surface 14 hectare of which 8 hectare available for new investors, infrastructure capable for hosting 4.000 engineers and scientists daily – business incubation surface 1.400m2
Planning	Inauguration phase 1 early 2019

Green, connected and automated mobility

Why Luxembourg?

* Big-data enabled applications

MEGA TRENDS OF GLOBAL AUTOMOTIVE FUTURE DEVELOPMENT: Paul Schockmel, IEE

Mega Trends

Paul Schockmel

VP Strategy, Business Development and Marketing

China's Belt & Road Initiative - ICT:

Automated Driving in Luxembourg with 5G Networks and Satellite Communications

ChinaLux

Luxembourg, October 16th, 2017

“We will see more change in the next 5 years than there’s been in the last 50”

Marry Barra, CEO of General Motors

What are the challenges

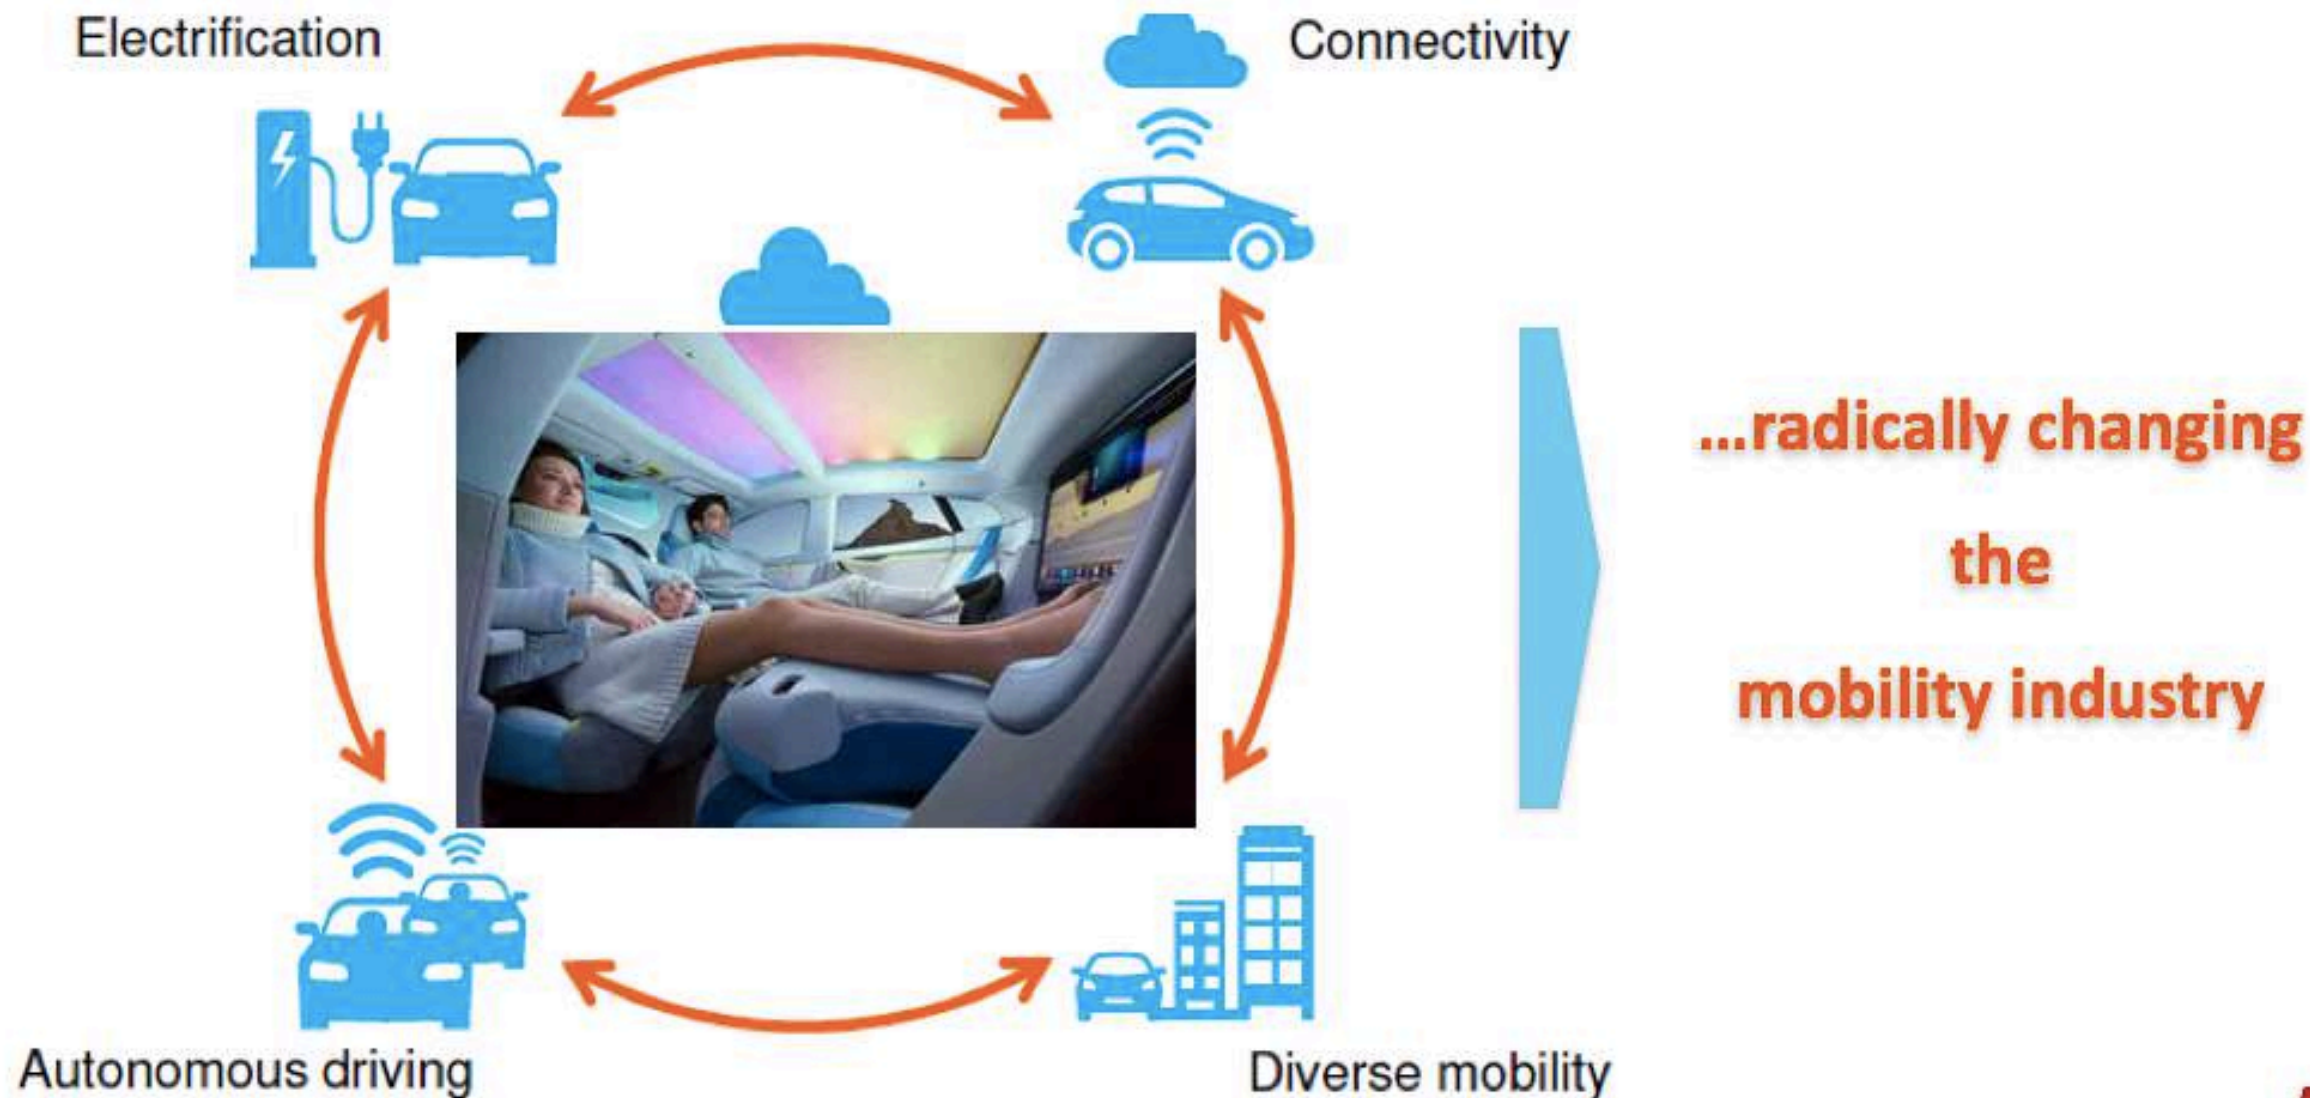

- Climate Change
- Air Quality

- Changing Consumer profiles
- Global Population Growth
- Urbansiation

- Cost & Profitability
- Economies of Scale

Disruptive technology-driven trends

The pathway to Autonomous Driving

Today
(~ 2015 -2022)

Autonomous driving is a reality in controlled restricted environments, e.g.

- Rio Tinto's autonomous trucks
 - Supervised autonomy by John Deere or full automation by New Holland
- 90% labour cost savings
 - 60% CO2 savings

Medium-term
(~ 2023 – 2040)

Trucks will likely be the first to enter the stage of autonomy on public roads, e.g.

- Daimler Future Truck 2025 prototype
 - Volvo sensor fusion system
- 30% operational cost savings

Long-term
(~ 2040 +)

Automated commercial fleets beyond cars, e.g.

- Connected/automated planes
 - Parcel deliver via drones (on a large scale)
- 50% operational cost savings

The pathway to Autonomous Driving

Transportation & Communication Cost
(Percent of Personal Income)

Passenger Vehicle Stock
(Millions)

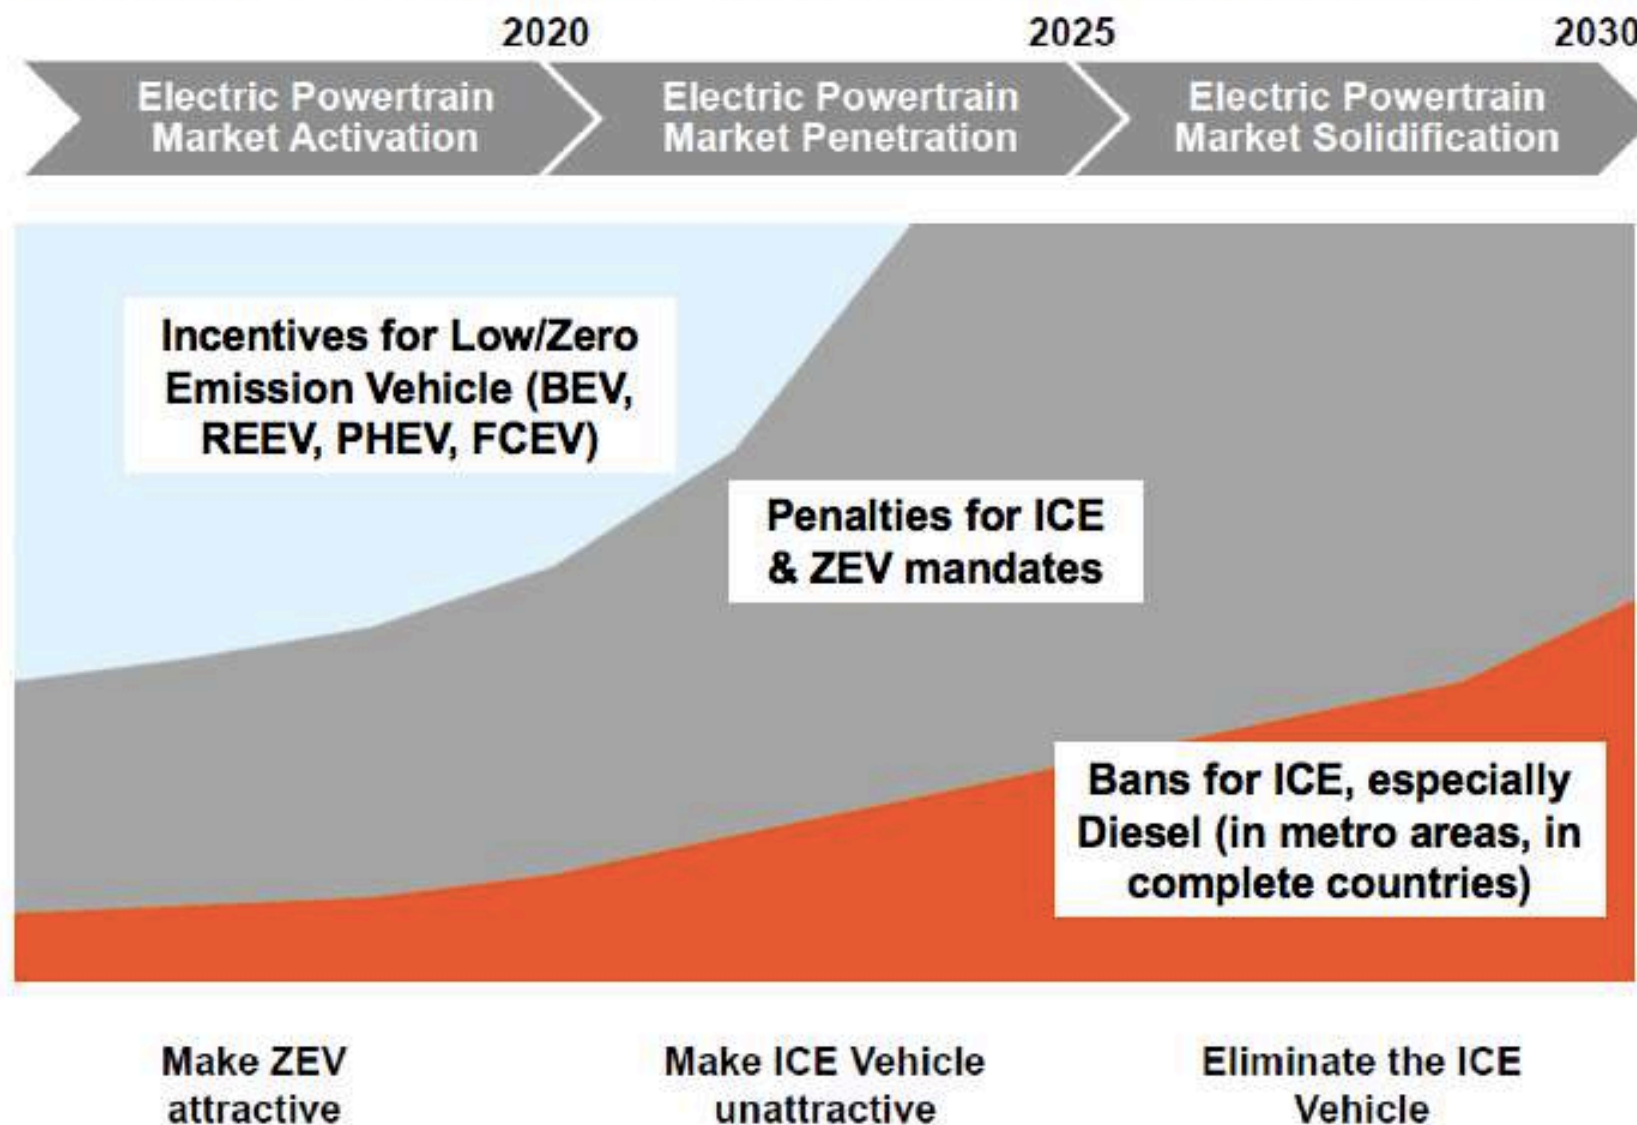

Connectivity and Big Data

The coming flood of data in autonomous vehicles

Zero Emission Vehicles

Move from ZEV incentives to Internal Combustion Engine (ICE) bans

Source: Ricardo

The new industry paradigm

- Changes in mobility behaviour and shifting markets
- Diffusion of advanced technologies
 - Automated driving
 - Connectivity solutions Big Data
 - Software
 - Electrical vehicles become viable and competitive
- New market entrants and cooperation models

SATELLITE COMMUNICATIONS SOLUTIONS FOR AUTOMATED DRIVING: Alexander Geurtz, SES

Satellite communications and automated driving

PRESENTED BY
Alexander Geurtz

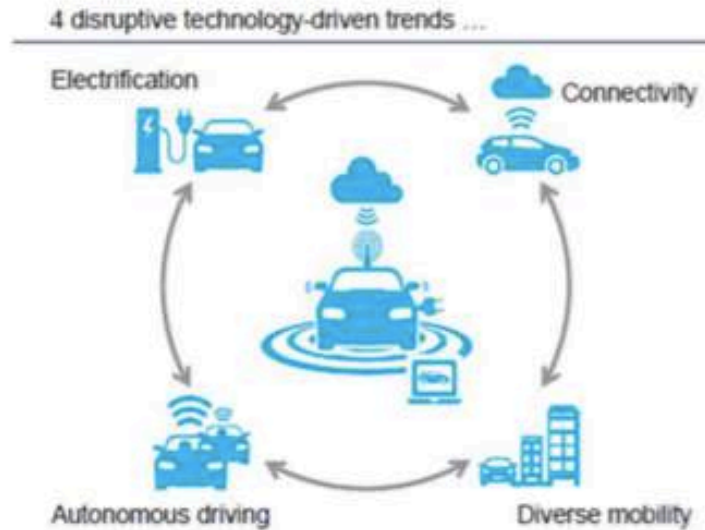

PRESENTED ON
16 October 2017

Outline of Presentation

- 1 Automated Driving – Key Enablers
- 2 Automated Driving – Why Satellites Matter
- 3 Automated Driving – Key Success Factors for Satellite
- 4 Automated Driving – Positioning SES for the Future
- 5 Conclusions

Automated Driving

Key Enablers

SOURCE: McKinsey

Automated Driving is part of a set of disruptive global trends

Connected car market to grow to USD 156 billion by 2022 from USD 35 billion in 2015 (Strategy& 2016)

SOURCE: McKinsey

Communications and data analysis capabilities enable the connected car

Automated Driving is expected to be a disruptive market opportunity. Communications capabilities, including 5G and satellite, represent a key enabler

Automated Driving

Why Satellites Matter

Key satellite features:
Ubiquity
Mobility
Broadcast
Security

Unique features of satellite bring unrivalled benefits to the global communications infrastructure

Automated Driving

Why Satellites Matter

Satellite 5G use cases (examples)

- ▲ Providing information and entertainment services
- ▲ Enabling Over the Air Firmware and Software (FOTA/SOTA) services
- ▲ Information updates such as map information including points of interest (POI)
- ▲ Real-time traffic and Parking availability
- ▲ Cyber Protection & Security Enhancements (e.g. alternate secure channel for global certificate and key management)
- ▲ Increased coverage and reliability for e-Call services, vehicle tracking and remote diagnostics
- ▲ Enhanced navigation and positioning

Source: ETSI

Satellite connectivity

Direct: connecting cars directly via satellite

Indirect: efficiently connecting, via satellite, mobile towers with large amounts of data through multicast and local storage (caching)

Satellite enable efficient collection and delivery of massive amounts of data across a wide area

**GEO wide beam**

- Over 50 satellite constellation in geostationary orbit
- Reaching 325 million TV households worldwide

**GEO HTS**

- Global High Throughput Satellite (HTS) platform in geostationary orbit
- Improving value proposition for data applications

**MEO HTS**

- 12 satellite Medium Earth Orbit (MEO) constellation plus 8 more launching from 2018
- High throughput, lowest latency
- 5 years ahead of competition

Automated Driving

Key Success Factors for Satellite

Success factor	Key Features
Disruptive network capabilities	Ubiquitous, high capacity satellite and ground network, fully integrated into 5G
Unparalleled user experience	Fostering key technologies and products: Low-cost car antennas Satellite-friendly applications
Innovative business models	Work closely with key stakeholders (e.g., Automotive, MNOs, Media, Device, Search and Social Media companies)

Positioning satellite successfully for the future of Automated Driving requires strategic determination. Network infrastructure, user experience and ecosystem elements are key to success

Automated Driving

Positioning SES for the Future

Success factor

Disruptive network capabilities

Unparalleled user experience

Innovative business models

Key Features

Ubiquitous, high capacity satellite and ground network, fully integrated into 5G

Fostering key technologies and products:
Low-cost car antennas
Satellite-friendly applications

Work closely with key stakeholders
(e.g., Automotive, MNOs, Media, Device, Search and Social Media companies)

SES Actions

PARTNER OF CHOICE
serving over 700 broadcasters, telcos, enterprises, governments and institutions in over 130 countries

Thanks to significant investments in disruptive satellite network capabilities and its leadership in the integration of satellite into 5G, SES is well-positioned for the future of Automated Driving

- ▲ **Automated Driving represents a huge opportunity, also for satellite**
- ▲ **Satellite's unique features (Ubiquity, Mobility, Broadcast and Security) can be of tremendous benefit to Automated Driving**
- ▲ **Network infrastructure (including satellite integration into 5G), user experience and ecosystem elements are key to success for satellite**
- ▲ **SES is well-positioned thanks to substantial investments in those key capabilities and ecosystem developments**

SPECTRUM RELATED TRENDS TOWARDS C2C-COMMUNICATIONS AND 5G: Claude Rischette, ILR

INSTITUT LUXEMBOURGEOIS
DE RÉGULATION

SPECTRUM RELATED TRENDS TOWARDS C2C-COMMUNICATIONS AND 5G

Claude Rischette
Head of Spectrum department

Outline

- Introduction
- Spectrum aspects on ITS
 - Spectrum harmonization for ITS
 - Coexistence of 2 evolutions
 - Possible scenarios
- European Activities on 5G and ITU steps towards 5G
 - 5G Action Plan
 - 5G Pioneer Frequency Bands

Outline

- Introduction
- Spectrum aspects on ITS
 - Spectrum harmonization for ITS
 - Coexistence of 2 evolutions
 - Possible scenarios
- European Activities on 5G and ITU steps towards 5G
 - 5G Action Plan
 - 5G Pioneer Frequency Bands

ITS and the impact of 5G to C2C Communication

- 5G will enable the “connected car” concept and the development of the **Intelligent Transportation Systems (ITS)** sector
 - 5G will provide high reliability, high data rates, low latency and massive connectivity and thus the requirements for supporting billions of connected cars will be fulfilled
 - Current *3G and 4G networks*, do not have that capacity to enable such a connected environment and to deliver safe and efficient services for car communications
 - 5G will ensure continuous and reliable reception from moving vehicles
 - Concept of virtualization and network slicing of 5G will be significant for implementing different use case for autonomous driving
 - 5G will support also a wide range of M2M/ IoT applications to enhance connectivity capabilities
- 5G will play therefore a **key role in the development of future ITS systems**

Outline

- Introduction
- Spectrum aspects on ITS
 - Spectrum harmonization for ITS
 - Coexistence of 2 evolutions
 - Possible scenarios
- European Activities on 5G and ITU steps towards 5G
 - 5G Action Plan
 - 5G Pioneer Frequency Bands

Spectrum harmonisation for ITS in Europe

- **Main band 5.9GHz (5.875-5.905MHz)**

- Supplemental band 63-64 GHz is designated for ITS for long term evolution

1. CEPT (*Conférence Européenne des Postes et Télécommunications*)

- Group representing 48 European regulatory administrations with the main goal to harmonize spectrum for different radiocommunication services
- CEPT Decisions are NOT binding, however, in general, high level of compliance as Decisions are developed in consensus
- In 2008, CEPT developed an ITS harmonization decision (ECC Decision (08)01) designating:
 - **30MHz**, for safety-related ITS (5.875-5.905 MHz)
 - **20MHz**, extension for safety-related ITS (5.905 – 5.925 MHz)

Spectrum harmonisation for ITS in Europe

2. European Commission (EC)

- **30MHz** are harmonized for **safety-related ITS** (5.875-5.905 MHz)
 - Mandatory implementation by Member States (*Decision EC/2008/671*)
- **New EC Mandate to CEPT** will be issued this year:
 - to analyse feasible extension of 20 MHz for **safety-related ITS (5.905-5.925MHz)**
 - CEPT act as a kind of technical body to develop compatibility studies for EC

Spectrum harmonisation for ITS in Europe

- Principles of **spectrum regulation**:
 - Technology neutrality of spectrum use
 - Spectrum regulation *does not make the choice of a technology*
 - e.g. all current and future harmonized bands for public mobile service are issued according to this principle
 - Consequence → **Market will decide**
 - Efficient use of spectrum
 - Uncompromised safety services for all users in case of multiple technologies implementation (for this ITS specific case)

Global spectrum harmonisation for ITS

- ITS on the agenda of next WRC-19 (World Radiocommunication Conference) in 2019
 - Objective: **global harmonization of ITS**
 - Band already harmonized in EU, USA, CAN and China
 - Good common basis reached already at this stage as all regions cooperate during preparation phase

Coexistence of 2 evolutions

- For the 5.9GHz band, we are facing a **parallel evolution for Intelligent Transport Systems (ITS)**, based on **2 different technologies**:
 - I. RLAN (wifi) based: **ITS-G5 (IEEE 802.11p)**
 - Developed for more than 10 years by automotive industry
 - Mature technology
 - II. LTE based: **LTE-V2X** (vehicle-to-X)
 - X corresponds to Vehicle, Infrastructure or Persons
 - Driven by mobile industry (manufacturers/suppliers and different supporting groups like 5G AA automotive association)

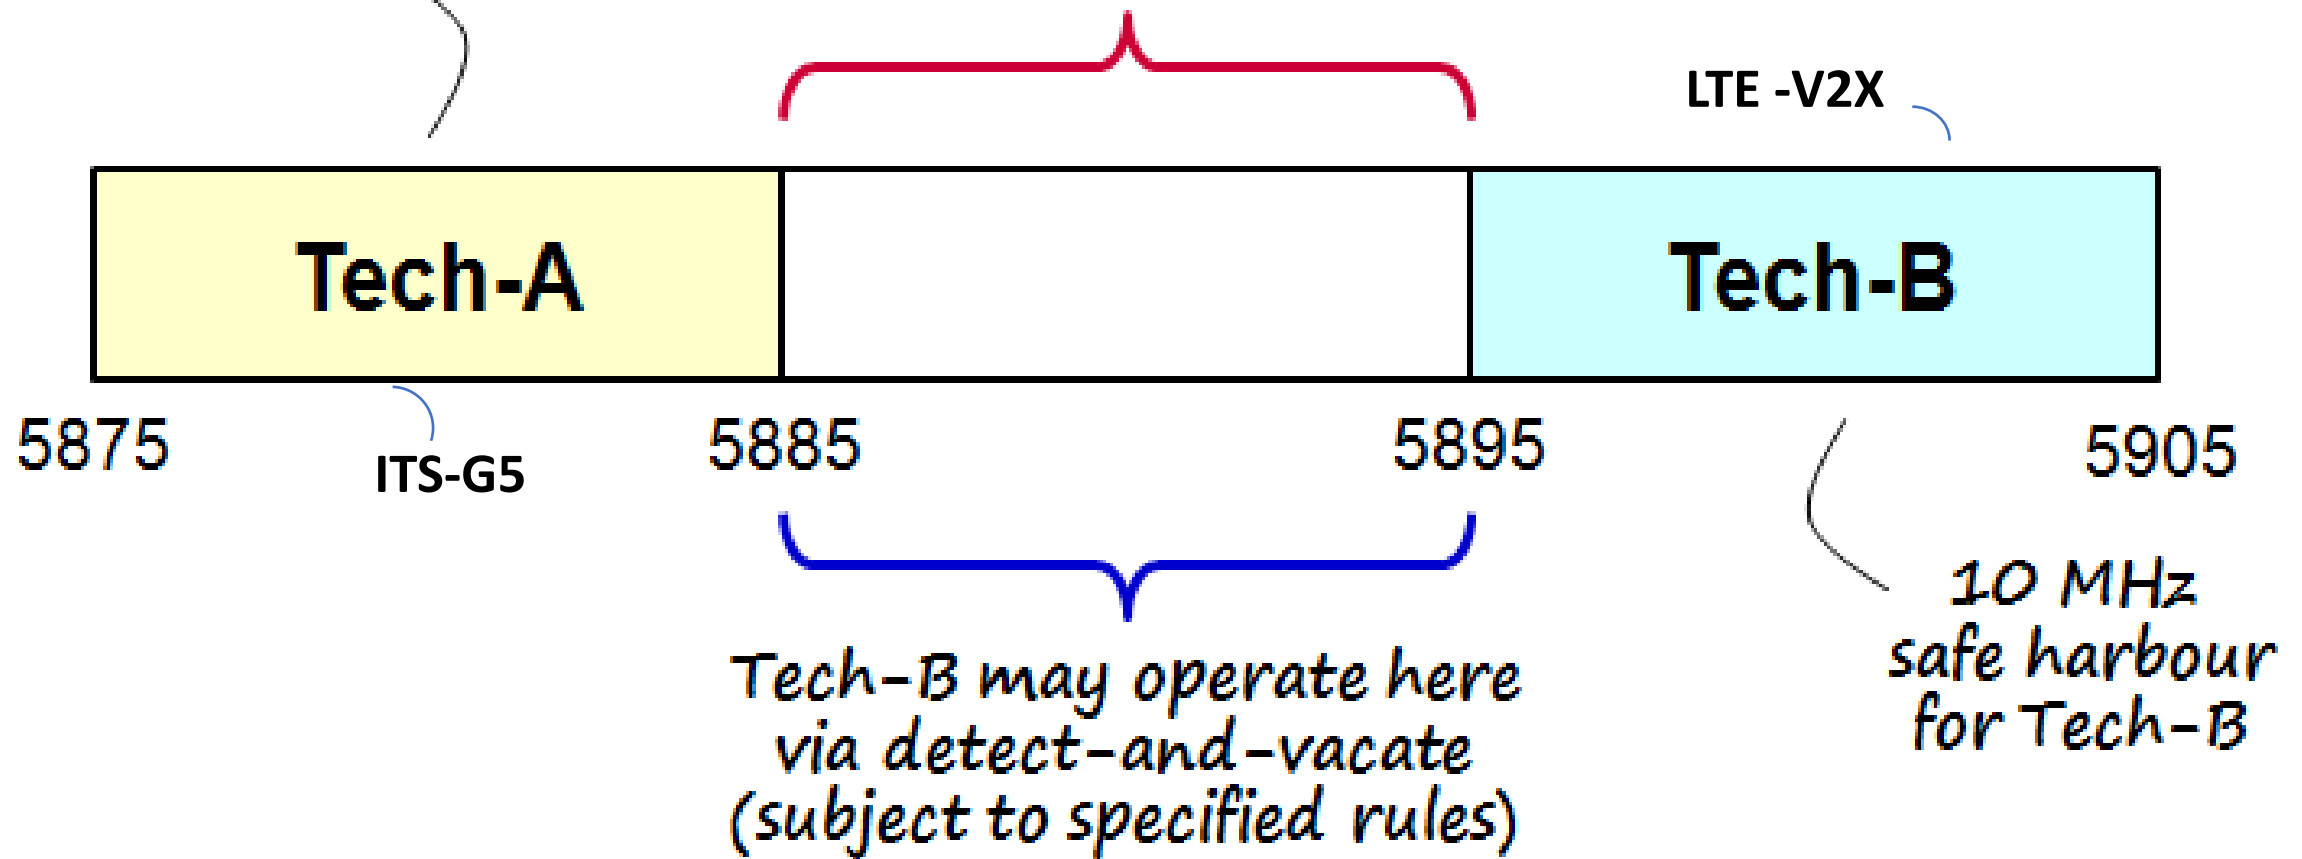

Coexistence of 2 evolutions

- Conflict as 2 technologies for ITS in the frequency band (**5.875-5.905MHz**)
 - could not co-exist in the same frequency band
 - could result in a fragmentation of the 5.9 GHz band
 - **RLAN (ITS-G5) community** claiming:
 - Incumbent service, compliant to ETSI standard (EN 302 571)
 - Some road infrastructure already deployed (e.g. motorways in France or Austria)
 - **LTE-V2X community** response:
 - No requirements for interoperability at this stage
 - No compliance to existing standard necessary (backward compatibility)
 - Short range technology would naturally be integrated in cellular networks

10 MHz
safe harbour
for Tech-A

Tech-A may operate here
via detect-and-vacate
(subject to specified rules).

Safe harbour option:
2 different technologies
Splitting band into 2 x 10MHz

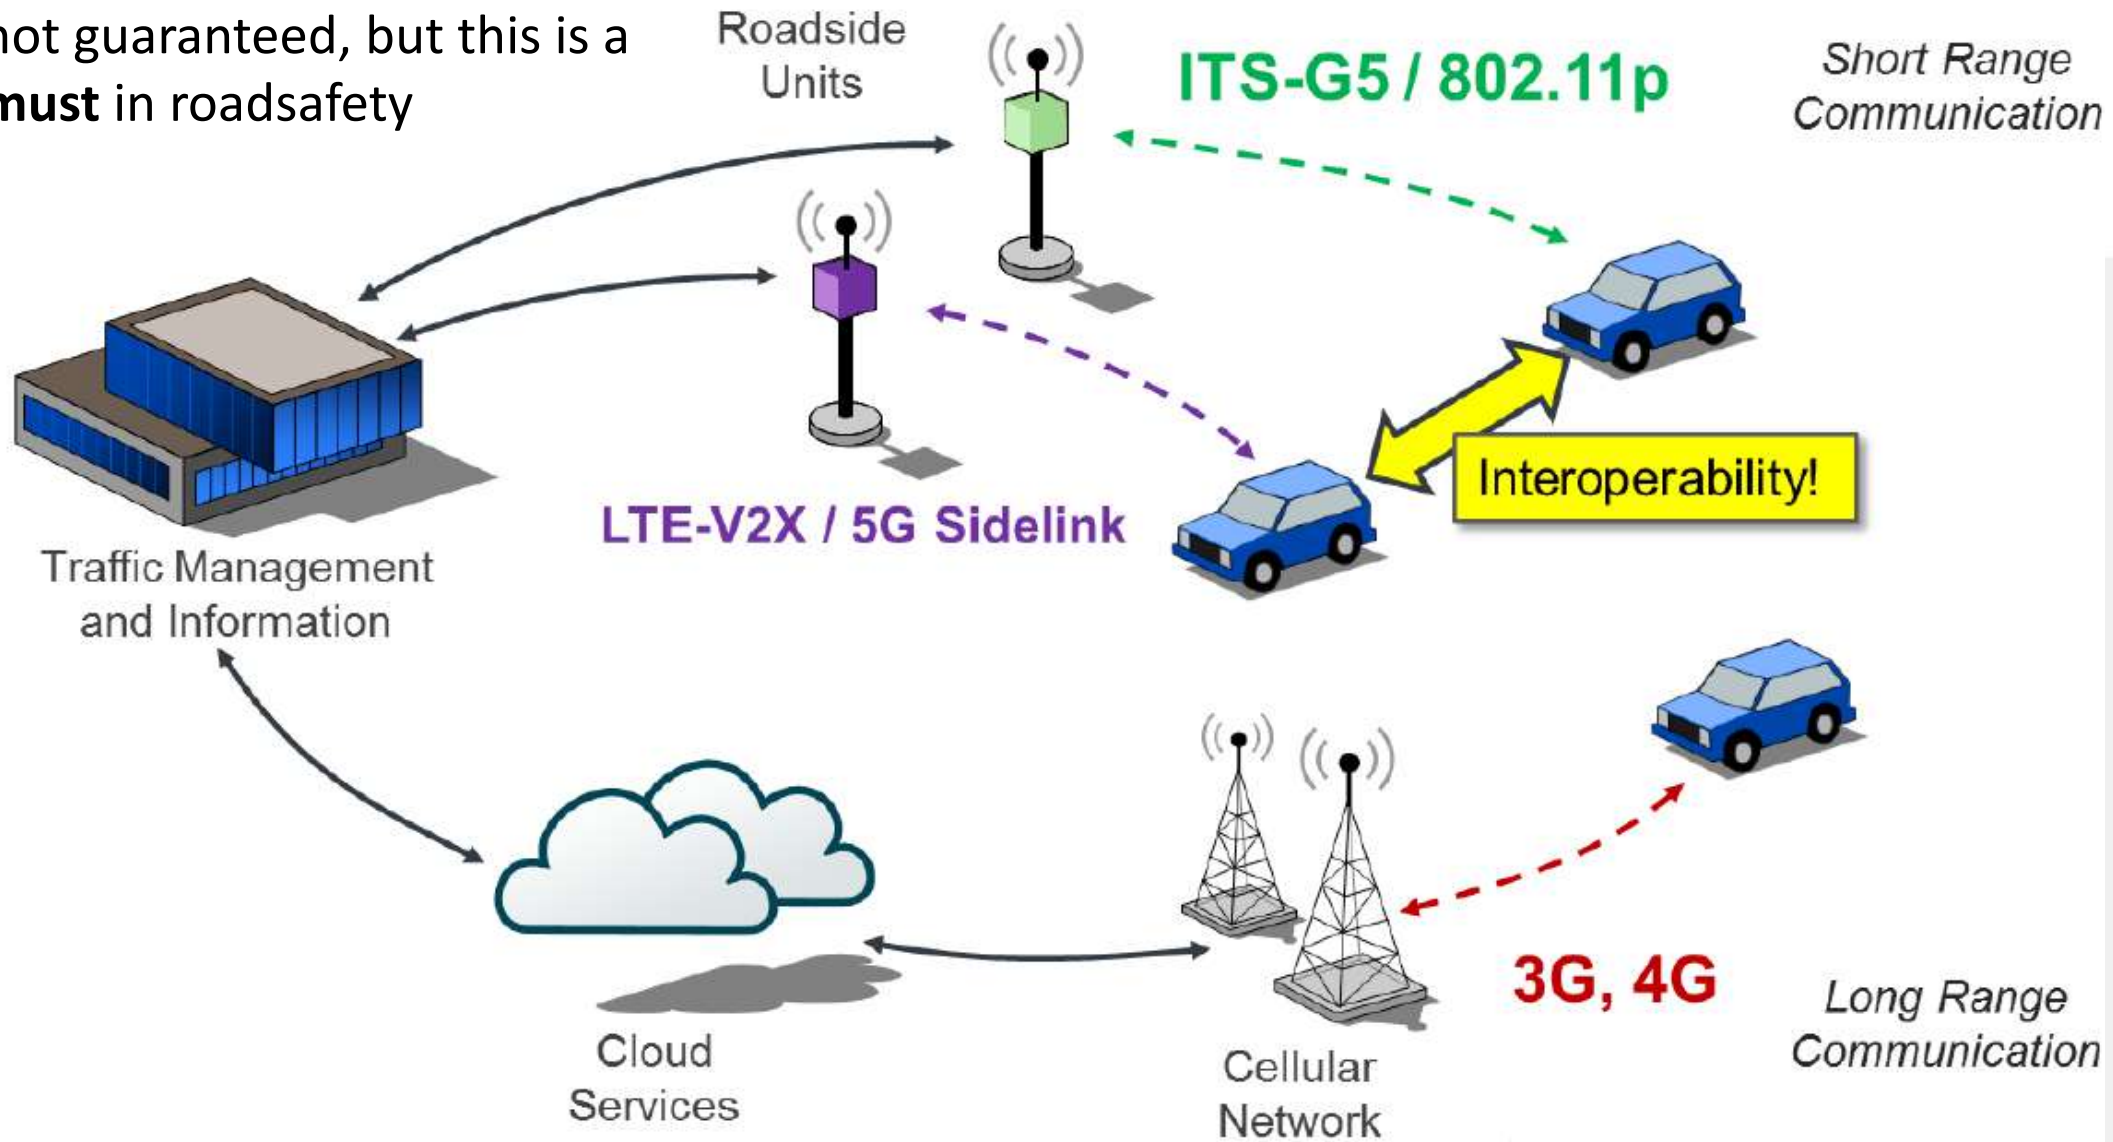

Source: www.5GAA.org

Possible scenarios

However, this might not be an optimal solution, at least not at a long term perspective, as:

- 2 different technologies deployed
- No efficient use of spectrum
- No investment certainty for automotive industry
- Long life cycles of vehicle to be considered
- Compatibility issue still not solved
- Solutions should be future proved, also in terms of future development of 5G

Interoperability at this stage
not guaranteed, but this is a
must in roadsafety

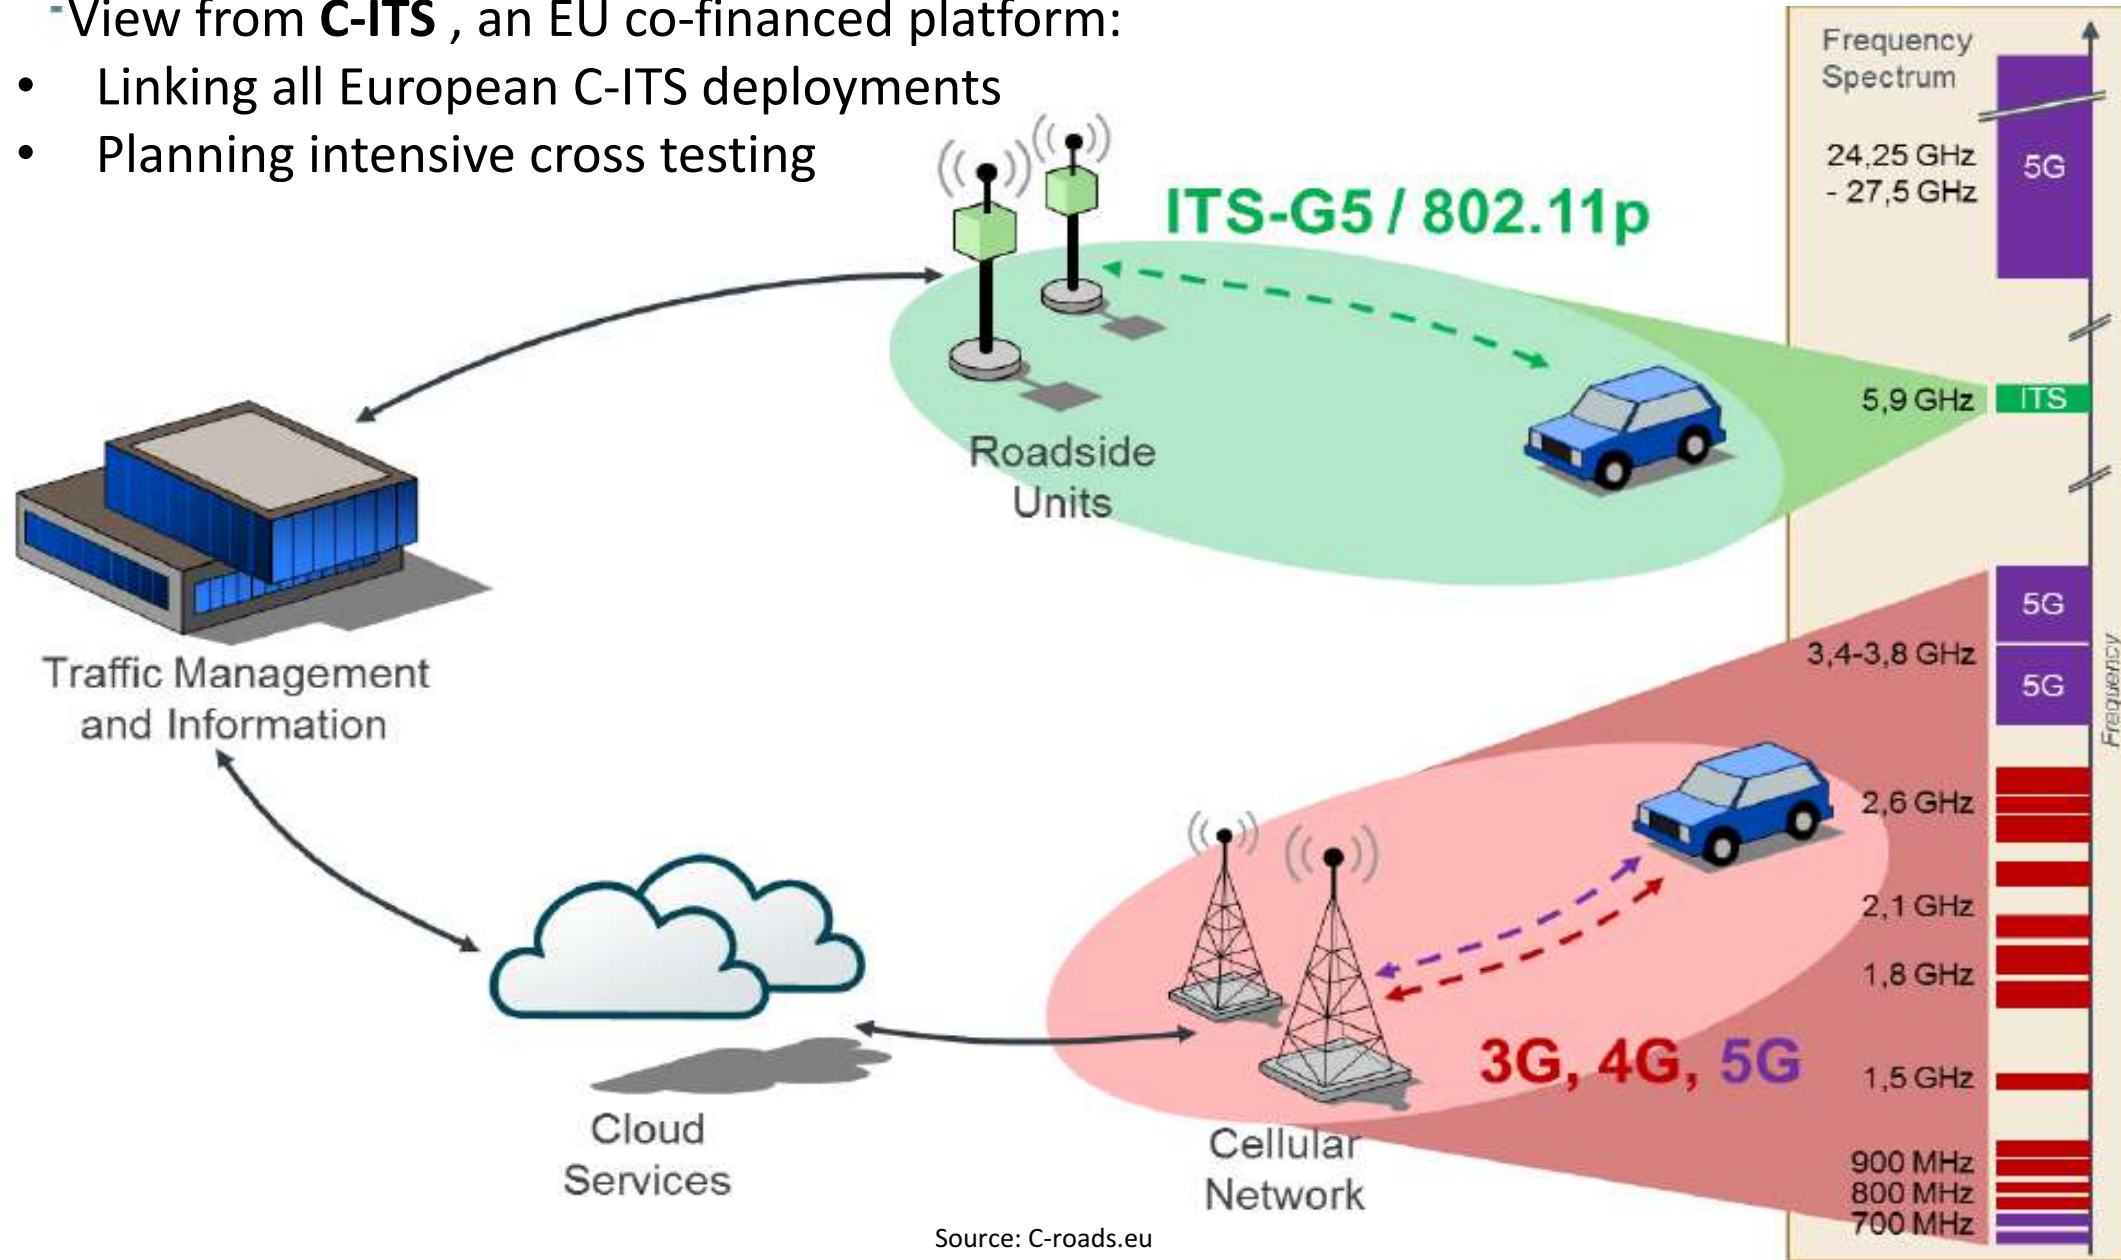

Source: C-roads.eu

Possible scenarios

- Some use cases require performances such as low latency , this could technically only be met by short range communication
- Some others need cellular, **managed services**
- **Not all ITS services are safety related**
- So, of combination of both demands might be the right option...

- Planning intensive cross testing

Possible scenarios

- This view might lead to a possible solution but still the remaining issue of interoperability
- Proponents of the 2 technologies must find a **common basis** to pave the way to guarantee rad safety for European citizens
- **Hybrid cooperation model with cellular V2X AND ITS-G5** might be the compromise solution:
- **Cellular V2X** would be operated:
 - in **licensed 5G bands**
- **ITS-G5** would be operated:
 - in **unlicensed 5.9GHz** band (as initial foreseen)
- **EU View:** Longer Term evolution of 5G is expected to bring further improvements in cellular communication
 - This should not compromise already deployed ITS services

Outline

- Introduction
- Spectrum aspects of ITS technologies
 - Co-existence of the 2 evolutions
 - Possible scenarios
- European Activities on 5G and ITU steps towards 5G
 - 5G Action Plan
 - 5G Pioneer Frequency Bands

European Commission (EC) – 5G Action Plan

- In the context of the **Digital Single Market** strategy, EC underlines the importance of 5G to strengthen Europe in order to compete in the global market
- The **5G Action Plan** has been adopted in September 2016, main targets:
 - **Early 5G launch** in selected areas in 2018
 - Commercial launch of 5G in at least **one major city of every MS until 2020**
 - **5G everywhere until 2025**
 - **MS** are encouraged **to develop national 5G deployment roadmaps** (by end 2017)

European Commission (EC) – 5G Action Plan

European Commission (EC) – Pioneer Bands

- EC has identified 3 main bands, called **‘Pioneer bands’** for early introduction of 5G:
 - **700MHz** (694 – 790 MHz)
 - 2 x 30MHz harmonised at EC level for 5G, mainly for **national and indoor coverage**
 - Band should be available by 2020
 - At a first step LTE technology will be used and later in 5G
 - **3400-3800 MHz**
 - 400MHz harmonised at EC level, mainly for **urban areas**
 - Throughputs in first pre-5G trials up to 2 Gb/s
 - Probably first band deployed in 5G in Europe, in other regions, only parts of this band is harmonised for 5G
 - **26GHz (24.25-27.5GHz)**
 - In total more than 3GHz in theory available, many incumbent use e.g. P2P/satellite services links
 - Very high throughputs possible for **very limited ranges**
 - Availability likely > 2020

ITU – Steps forward for 5G

- **WRC-19 (World Radiocommunication Conference)** in November 2019, organised every 4 years by ITU
- Following candidate bands for 5G are currently studied with regard to compatibility to other existing radio services in these bands
- Goal is during negotiations at WRC-19 worldwide harmonisation for several of these bands:
 - 24.25-27.5 GHz
 - 31.8-33.4 GHz
 - 37-40.5 GHz
 - 40.5-42.5 GHz
 - 42.5-43.5 GHz
 - 45.5-50.2 GHz
 - 50.4-52.6 GHz
 - 66-76 GHz
 - 81-86 GHz

Many thanks for your attention!
